

Who Are The Enemies? What Can They Do?

Internet Software Security Issues
in the Software Development
Process

Dr Charles P Pfleeger

Pfleeger Consulting Group

chuck@pfleeger.com

Overview

Overview

- ❑ Security Process
- ❑ Many Kinds of Threat Agents
- ❑ Countering Threats
- ❑ Software Process
- ❑ Improving Security in Software

What Developers Should Know about Security

What Developers Should Know about Security

- ❑ Security is not automatic
- ❑ People and situations are hostile
- ❑ Security can be tricky
- ❑ No magic technique or checklist leads to security
- ❑ *BUT* security *can* be compatible with good development processes

Security Considerations

- Goals
- Threats and Vulnerabilities
- Method + Opportunity + Motive
- Controls

What Security Is

- Confidentiality

- information available for reading only when authorized

- Integrity

- information available for modification only when authorized

- Availability

- information available for use when authorized

Threat Sources

Threat Sources

□ Natural

- Fire, flood, hardware failure

□ Human

■ Unintentional

- ◆ Errors (accidental file deletion)
- ◆ Omissions (missing data)

■ Intentional

- ◆ Outsiders
- ◆ Insiders

Method + Opportunity + Motive

Method + Opportunity + Motive

- Method
 - tools, techniques, knowledge
- Opportunity
 - access, ability
 - work factor: difficulty, time
- Motive
 - reason (if any)

Types of Harm

Types of Harm

- Confidentiality
 - Reveal private data
- Integrity
 - Damage or delete data
- Availability
 - Denial of access or service

Controls

- Physical
 - Guards, fences, sprinklers
- Administrative — Logical
 - Policies, laws
- Technical
 - Devices (login tokens)
 - Software (intrusion monitors)
 - Combinations (network monitoring)

Why Security is Hard (1)

- ❑ The defender must counter all threats; an attacker needs only one vulnerability
- ❑ Developers can introduce/allow flaws without knowing it
- ❑ Testing may not demonstrate security
- ❑ Harm can come from intentional or unintentional causes

Why Security is Hard (2)

- ❑ Is 1000 the same as 1,000?
- ❑ Is *invisible text* acceptable?
- ❑ Does efficiency—or inefficiency—matter?
- ❑ Does order matter?

Why Security is Hard (3)

- How can you demonstrate protection?
- How can you justify spending for security?
- Security is not just a set of features

Security Conclusions

Security Conclusions

- ❑ No one person—or group—alone can be responsible for security
- ❑ Solid security is not added at the end
- ❑ Security is hard

Security Design Concepts

Security Design Concepts

- *Common sense*
- Saltzer and Schroeder documented and published in 1975
- Others (Viega & McGraw, Howard & LeBlanc, NIST, OWASP, more) build on Saltzer and Schroeder

Saltzer and Schroeder

- ❑ Economy of mechanism
- ❑ Fail safe defaults
- ❑ Complete mediation
- ❑ Open design
- ❑ Separation of privilege
- ❑ Least privilege, permission-based
- ❑ Least common mechanism
- ❑ Ease of use

Viega and McGraw

- ❑ Secure the weakest link
- ❑ Keep it simple
- ❑ Promote privacy
- ❑ Remember that hiding secrets is hard
- ❑ Be reluctant to trust
- ❑ Use community resources

Howard and LeBlanc

- ❑ Minimize attack surface
- ❑ Assume external systems are insecure
- ❑ Security features are not the same as secure features
- ❑ Don't mix code and data
- ❑ Plan for failure
- ❑ Learn from mistakes
- ❑ Backward compatibility is tricky
- ❑ Fix security issues correctly

Security Control Philosophy

Security Control Philosophy

- ❑ Secure perimeter
- ❑ Control of users and environment (devices, software)
- ❑ Defense in depth
- ❑ “Perfect” (secure) software

Web Characteristics

Web Characteristics

- ❑ Wide availability, to the masses
- ❑ Mandatory presence
- ❑ Very low cost of entry
- ❑ Very low skill to enter
- ❑ Low genetic diversity
- ❑ Very rapid technology turnover
- ❑ High demand for “oh, wow”

Software Development vs. the Web

- | | |
|--|--|
| <ul style="list-style-type: none">□ Orderly, managed process | <ul style="list-style-type: none">□ Unmanaged |
| <ul style="list-style-type: none">□ Well-defined system | <ul style="list-style-type: none">□ No perimeter; constant change |
| <ul style="list-style-type: none">□ Well-defined requirements | <ul style="list-style-type: none">□ Programs used-reused for any situation |
| <ul style="list-style-type: none">□ Integrated testing | <ul style="list-style-type: none">□ Testing varies |
| <ul style="list-style-type: none">□ Continuous improvement | <ul style="list-style-type: none">□ Little feedback |
| <ul style="list-style-type: none">□ Controllable => securable | <ul style="list-style-type: none">□ Uncontrolled => unsecured |

Some Sources of Computer Incidents

- ❑ Errors
- ❑ Insiders
 - Nonmalicious and malicious
- ❑ Hackers
- ❑ Organizations
- ❑ Terrorists

Errors

Errors

- Humans are human
- Errors are unintentional
 - Pressure, distraction, confusion
- Random

Insiders

Insiders

- Insiders account for much harm
 - Many insiders, many actions
 - Much power
- Most insider harm is unintentional
- Intentional harm from anger, pay-off, values conflict

Hackers

Hackers

- Individuals, loose federations
- Motivation
 - Personal
- Objective
 - Experience, fame
- Impact
 - Modest
 - Sometimes accidental side effects

Hackers' Motivations

Self-gratification, addiction, espionage, theft, profit, vengeance, sabotage, freedom, 27%

Recognition, excitement (illegal activity), friendship, 24%

Challenge, knowledge, pleasure, 49%

Denning 1999, citing Chantler

22 Outubro 2009

WAMPS 2009 - Workshop Anual do MPS

37

Disturbing Hacker Trends

- ~0-day exploits
- Bagle, Netsky, Zafi worm writers join forces
- Enormous botnets for rent
- Conficker very sophisticated; evolving

Organized Crime

Organized bureaucracies (computer work is only one activity)

- Motivation
 - Financial
- Objective
 - Fraud, extortion
- Impact
 - e.g., identity theft, credit

Intelligence Services

□ Motivation

- Data: political, economic, military
 - ◆ needs of military during engagement
 - ◆ about potentially hostile nations
 - ◆ transnational threats (drugs, WMD)

□ Objective

- Mostly to learn
- Sometimes to influence world
- Occasionally to act

Terrorists

Terrorists

□ Motivation

- Ideological, political

□ Objective

- Intelligence gathering
- Psychological
 - ◆ fear, panic, persuasion, misinformation
- “Mass annoyance” to “mass disruption”

Cyber Warfare Activities

- ❑ Disruption
- ❑ Sabotage
- ❑ Denial of service
- ❑ Misinformation
- ❑ Deception

Uses of Computers in Terrorism

- Disseminate information
 - web pages, desktop publishing
- Communicate with each other
- Gather, hold, analyze information
 - data mining, web browsing
- Target computers (uncommon)
 - unauthorized access (read, write, delete)
 - denial of service

Why Cyber-Advertising (and Spam) Is Attractive

- ❑ Remote operation, anonymous
- ❑ Massive reach, low cost
- ❑ Agile, easy to change, tune
- ❑ Message tuned to audience (coupled with data mining)
- ❑ Novel campaign garners media attention

Why Cyber-Terrorism Is Also Attractive

- ❑ Remote operation, anonymous
- ❑ Massive reach, low cost
- ❑ Agile, easy to change, tune
- ❑ Message tuned to audience (coupled with data mining)
- ❑ Novel campaign garners media attention

The Medium Is the Message

- The Internet may be worth more as a communications medium than a target
- Individual nodes—or whole subdomains—can still be targets

Lessons (To Be) Learned

- Evidence of vulnerability is visible to others
- Attackers work together
- Talk (articles, blogs) may alert them to weaknesses

Recent Events

- 2008 attack on firewall of China
 - Apparently political
- 2006 top level domain server DOS attack
 - 2002 disabled 8/13 root name servers
 - ◆ Apparently a simple ICMP packet flood
- 2007 attack on Estonia web
 - Motive unknown; testing?
- 2003 power blackout in NE Canada, US
 - Apparently tree limbs, cascading errors
- 2000 attack on wastewater treatment control center
 - Apparently a disgruntled former employee

Interdependent Risk

- One company, two divisions, both at risk of catastrophic (company) failure
 - If Division 1 invests in risk-reduction, it remains at risk unless Division 2 does also
 - In fact, Division 1's investment is wasteful if Division 2 does not invest
- What is incentive for an interdependent multi-corporation industry (power, finance, telecommunications) to invest in security?

Playing Security Analyst: A Smart Terrorist Would ...

- ❑ Plan, research, experiment
- ❑ Plant attacks today for use tomorrow
- ❑ Diversify the approach
- ❑ Implement multiple concurrent attacks
- ❑ Use different approaches to “come from all directions”

Software Process

Software Process Models

- ❑ MPS.BR
- ❑ CMMI
- ❑ ISO 9000
- ❑ Others

Common Aspects

- ❑ Establish an organizational policy
- ❑ Plan and define a process
- ❑ Monitor and control the process
- ❑ Evaluate adherence
- ❑ Collect improvement information
- ❑ Correct root causes of problems
- ❑ Ensure continuous improvement

Basic Process Areas

Basic Process Areas

- ❑ Requirements development
- ❑ Project planning
- ❑ Project monitoring and control
- ❑ Measurement and analysis
- ❑ Process and product quality assurance
- ❑ Configuration management

Measurement

Measurement

- What is important to measure
- How to measure it
- How precise the measurement must be
- How to interpret the measurement
- How to use measurement to improve

System Development Controls

- ❑ System development lifecycle
- ❑ Requirements determination
- ❑ Protection specifications development
- ❑ Design review
- ❑ System test review
- ❑ Certification and accreditation
- ❑ Service level agreement

Conclusions: What to Do?

What to Do: Process

- ❑ Requirements development
- ❑ Project planning
- ❑ Project monitoring and control
- ❑ Measurement and analysis
- ❑ Process and product quality assurance
- ❑ Configuration management
- ❑ Include security requirements
- ❑ Security overseer
- ❑ Threat-control analysis
- ❑ Security control coverage
- ❑ Security testing at all stages
- ❑ Security review prior to stage release

What to Do: Design

- ❑ Include security from the start
- ❑ Make security trade-off decisions visible and based on balance of competing factors
- ❑ Ensure a security expert is integral part of design team
- ❑ Ensure that project team members are all sensitive to security

What to Do: Measurement

- What is important to measure
- How to measure it
- How precise the measurement must be
- How to interpret the measurement
